

We Mercies

Care for Creation

As we take the first step, let us remember the traditional custodians of the land

The World is Blue

April 2018
Ed. Anne McLay

This globe strikingly represents how “blue” our world is:

The Pacific alone covers 58,925,815 square miles of Earth’s surface, and that’s not even half of the total surface area covered by all the world’s oceans.

Home to millions of species and responsible for driving climate, regulating temperatures, and governing planetary chemistry, the ocean makes life on Earth possible, and its health and protection are issues of critical importance to all of us.

Sylvia Earle is an oceanographer and author of
'The World is Blue How Our Fate and the Oceans are One.'

She is passionate about protecting the world's oceans and advocates a network of marine parks.

She has made the focus of her research the ecology and conservation of marine ecosystems, with special reference to marine algae and development of technology for access to and research in the deep sea.

She has been called Her Deepness.

She claims health of the ocean means health for us.
